# CS335: COMPILER DESIGN - Assignment 2

## Harsh Bihany (210406)

# Problem 1

Consider the following context-free grammar. The terminal symbols are **id** ( ) * **,** and $. *Function* is the start nonterminal.

$$Function \rightarrow Type \; \mathbf{id} \; (Arguments)$$
$$Type \rightarrow \mathbf{id}$$
$$Type \rightarrow Type*$$
$$Arguments \rightarrow ArgList$$
$$Arguments \rightarrow \epsilon$$
$$ArgList \rightarrow Type \; \mathbf{id} \, , ArgList$$
$$ArgList \rightarrow Type \; \mathbf{id}$$

(i) Explain why the grammar is not LL(1)?

A grammar is *left recursive* if it has a non-terminal $A$ such that there exists a derivation $A \xrightarrow{*} A\alpha$ for some string $\alpha$. In the following grammar we have one such derivation $Type \rightarrow Type*$.

Further a left recursive grammar cannot be LL(1). Hence the above grammar is not LL(1).

(ii) Perform required transformations on the grammar to make it LL(1). You may introduce new nonterminals. Show your transformed grammar.

To make the grammar LL(1), we need two things. Elimination of direct and indirect left recursion and left factoring to eliminate backtracking if needed.

Removing the direct left recursion mentioned earlier. We get

$$Function \rightarrow Type \; \mathbf{id} \; (Arguments)$$
$$Type \rightarrow \mathbf{id} \; Type'$$
$$Type' \rightarrow *Type'$$
$$Type' \rightarrow \epsilon$$
$$Arguments \rightarrow ArgList$$
$$Arguments \rightarrow \epsilon$$
$$ArgList \rightarrow Type \; \mathbf{id} \, , ArgList$$
$$ArgList \rightarrow Type \; \mathbf{id}$$

Now, after left factoring (required for the nonterminal $ArgList$) we get,

$$Function \rightarrow Type \ \textbf{id} \ (Arguments) \tag{1}$$

$$Type \rightarrow \textbf{id} \ Type^{'} \tag{2}$$

$$Type^{'} \rightarrow *Type^{'} \tag{3}$$

$$Type^{'} \rightarrow \epsilon \tag{4}$$

$$Arguments \rightarrow ArgList \tag{5}$$

$$Arguments \rightarrow \epsilon \tag{6}$$

$$ArgList \rightarrow Type \ \textbf{id} \ More \tag{7}$$

$$More \rightarrow \textbf{,} \ ArgList \tag{8}$$

$$More \rightarrow \epsilon \tag{9}$$

*Remark.* The productions are labeled so that they can be referred subsequently.

(iii) Show FIRST and FOLLOW set for the nonterminals in your transformed grammar.

$$\text{FIRST}(\textbf{T}) = \{\textbf{T}\} \quad \forall \textbf{T} \in \{\textbf{id}, (, ), *, \textbf{,}, \$, \epsilon\}$$

$$\text{FIRST}(Function) = \{\textbf{id}\}$$

$$\text{FIRST}(Type) = \{\textbf{id}\}$$

$$\text{FIRST}(Type^{'}) = \{*, \epsilon\}$$

$$\text{FIRST}(Arguments) = \{\textbf{id}, \epsilon\}$$

$$\text{FIRST}(ArgList) = \{\textbf{id}\}$$

$$\text{FIRST}(More) = \{\textbf{,}, \epsilon\}$$

$$\text{FOLLOW}(Function) = \{\$\}$$

$$\text{FOLLOW}(Type) = \{\textbf{id}\}$$

$$\text{FOLLOW}(Type^{'}) = \{\textbf{id}\}$$

$$\text{FOLLOW}(Arguments) = \{)\}$$

$$\text{FOLLOW}(ArgList) = \{)\}$$

$$\text{FOLLOW}(More) = \{)\}$$

(iv) Show the predictive LL(1) parsing table for your transformed grammar. You do not need to show the working of the parser with an example input string.

| NON-TERMINALS | INPUTS | | | | | |
|---|---|---|---|---|---|---|
| | $ | ( | ) | **id** | * | **,** |
| *Function* | | | | (1) | | |
| *Type* | | | | (2) | | |
| *Type*$'$ | | | | (4) | (3) | |
| *Arguments* | | | (6) | (5) | | |
| *ArgList* | | | | (7) | | |
| *More* | | | (9) | | | (8) |

Table 1.1: Predictive LL(1) Parsing Table

# Problem 2

Consider the following context-free grammar. The terminal symbols are $a, b, p, q, r, s$, and $t$. $S$ is the start nonterminal.

$$S \rightarrow LM \mid Lp \mid qLr \mid sr \mid qsp$$
$$L \rightarrow aMb \mid s \mid t$$
$$M \rightarrow t$$

(i) Is the given CFG SLR(1)?

After augmentation of the grammar and numbering the productions:

$$S' \rightarrow S \tag{0}$$
$$S \rightarrow LM \tag{1}$$
$$S \rightarrow Lp \tag{2}$$
$$S \rightarrow qLr \tag{3}$$
$$S \rightarrow sr \tag{4}$$
$$S \rightarrow qsp \tag{5}$$
$$L \rightarrow aMb \tag{6}$$
$$L \rightarrow s \tag{7}$$
$$L \rightarrow t \tag{8}$$
$$M \rightarrow t \tag{9}$$

The *FIRST* and *FOLLOW* sets are as follows:

$\text{FIRST}(\mathbf{T}) = \{\mathbf{T}\} \quad \forall \mathbf{T} \in \{a, b, p, q, r, s, t\}$        $\text{FOLLOW}(S') = \{\$\}$

$\text{FIRST}(S) = \{a, q, s, t\}$        $\text{FOLLOW}(S) = \{\$\}$

$\text{FIRST}(L) = \{a, s, t\}$        $\text{FOLLOW}(L) = \{p, r, t\}$

$\text{FIRST}(M) = \{t\}$        $\text{FOLLOW}(M) = \{\$, b\}$

Now onto the $LR(0)$ canonical collection

$I_0 = \text{Closure}(\{[S' \to \cdot S]\})$
$\quad = \{[S' \to \cdot S],$
$\quad\quad [S \to \cdot LM],$
$\quad\quad [S \to \cdot Lp],$
$\quad\quad [S \to \cdot qLr],$

Table 2.2: LALR(1) Parsing table

# Problem 3

## 3.1 Execution Details

To execute the parser, run the following command:

./qrun.sh <relative−path>

    For example:

./qrun.sh ./testcases/t1.quiz

**Note.** *After extracting the zip into the directory, there might be a need to make the attached script executable. Kindly chmod the bash script accordingly.*

## 3.2 Error Specification

The parser handles very specific error, which are listed as follows

### 3.2.1 Trailing/Floating close question tags

If a question `singleselect` or `multiselect` question tag does not have a opening tag then the parser should yield an error.
    For example, consider a statement like  ... `</singleselect>`, the parser reports an error (replace the ellipsis by `choices` and `correct` tags):

line no.: <no.>        No opening tag (singleselect).

    <no.> is replaced by the appropriate line number.

### 3.2.2 Unclosed question tags

If a question `singleselect` or `multiselect` question tag does not have a opening tag then the parser should yield an error.
    For example, consider a statement like `<singleselect marks = "4 ">` ... , the parser reports an error (replace the ellipsis by `choices` and `correct` tags):

line no.: <no.>        No closing tag (singleselect).

### 3.2.3 Integral marks

If the `marks` within a question tag is not an integral value, then the parser should report an error.
    For example, consider a statement like `<singleselect marks = "4 ab">` ... `</singleselect>`, the parser reports an error (replace the ellipsis by `choices` and `correct` tags):

line no.: <no.>        Marks should be natural numbers.

### 3.2.4 Marks range

If the `marks` within a question tag is an integral value, but not within the range $[1, 8]$, then the parser should report an error.

For example, consider a statement like `<singleselect marks = "45"> ... </singleselect>`, the parser reports an error (replace the ellipsis by `choices` and `correct` tags):

```
line no.: <no.>          Marks should be in the range 1−8.
```

### 3.2.5 Enclosed in quotations

If the `marks` attribute within a question tag is not assigned to something within double quotes, then the parser should report an error.

For example, consider a statement like `<singleselect marks = 45> ... </singleselect>`, the parser reports an error (replace the ellipsis by `choices` and `correct` tags):

```
line no.: <no.>          Enclose the marks in double quotes.
```

### 3.2.6 Valid choice and correct tags

If the number of correct and choice tags within a question are *incorrect*, then the parser should report an error. The number of these tags can be correct in the following case:
  - If the question if a `singlselect` type, then the number of `correct` tags should be 1 and the number of `choice` tags should be either 3 or 4.
  - If the question if a `singlselect` type, then the number of `correct` tags should be less than or equal to the number of `choice` tags and the number of `choice` tags should be either 3 or 4.

Any other case should lead in an error, for example, consider a statement like the following, the parser reports an error

```
<singleselect marks="4">
Question 1
        <choice> 78 </choice>
        <choice> 79 </choice>
        <choice> 80 </choice>
</singleselect>
```

```
line no.: <no.>          Error in single select question: in terms of number of choice
and correct tags.
```

**Note.** *In case of arbitrary inputs, the parser gives undefined outputs. It may produce a generic* `syntax error` *error. Further, the statistics produced by the parser are only for a correct tag, i.e., only after a correct tag closes (say a* `singleselect`*), are it stats updated in the counters. If error is detected midway between parsing a question, then its stats are not counted and the parser terminates by producing the stats uptil before that question tag, and a error message.*
